("Conroy" or "the Company")

**POSITIVE SLIEVE GLAH STRUCTURAL STUDY**

- **Slieve Glah area shown to be highly prospective for gold mineralisation**
- **Structural Study at Slieve Glah identifies Gold Target Zones**
- **Study highlights significance of the Orlock Bridge Fault on gold mineralisation**

Conroy Gold and Natural Resources plc (AIM: CGNR, ESM: CGNR.I), the gold exploration and mine development company focused on Ireland and Finland is pleased to announce positive results from an Independent Structural Study undertaken at its Slieve Glah target in County Cavan, Ireland.

The study was carried out by independent consultant structural geologists, Dr. Francis Murphy and Dr. David Coller. The study showed that the gold mineralisation at Slieve Glah is associated with a major geological structure, the Orlock Bridge Fault. It highlighted the potential for a concentration of gold mineralised faults and of gold target zones within the gold-in-soil anomalies defined by the Company, which are approximately 3 km (1.8 miles) in length.

The Slieve Glah area is located approximately 40 km (25 miles) to the south east of the Company's proposed gold mine at Clontibret in County Monaghan. The Orlock Bridge Fault undergoes a significant strike swing, or bend, at Slieve Glah. This has led to the development of a dilation zone which could hold significant mineral potential.

This release has been approved by Kevin McNulty PGeo, who is a member of the Company's technical staff, who holds a BSc/MSc in Geology and Remote Sensing, in accordance with the guidance note for Mining, Oil & Gas Companies issued by the London Stock Exchange in respect of AIM Companies, which outlines standards of disclosure for mineral projects.

**Professor Richard Conroy, Chairman commented:**

*"The positive results of this Independent Structural Study add further evidence of the gold potential in the Slieve Glah area and the entire thirty mile gold district in Ireland that the Company has discovered."*

*"Slieve Glah is a very large target area and, although exploration is at an early stage, the potential and size of the gold anomalies there is exciting."*
